Placebo and Pain: Chapter 6. Spinal Mechanisms of Placebo Analgesia and Nocebo Hyperalgesia: Descending Inhibitory and Facilitatory Influences Serge Marchand

There is good evidence that placebo and nocebo responses reflect more than a psychologic reappraisal of pain perception. In fact, pain perception is the endpoint of several endogenous pain inhibitory and facilitatory mechanisms that trigger descending pain modulation mechanisms to the spinal cord. Measuring the ability of placebo and nocebo to act on these mechanisms will demonstrate that their effects are not only a reinterpretation of higher centers of the same nociceptive signal, but are acting at the source of this signal at the spinal level. This information is important considering that the capacity to trigger endogenous pain modulation mechanisms is a good predictor of pain chronification. This chapter addresses the importance of psychologic factors on endogenous pain facilitatory and inhibitory mechanisms in the central nervous system, from the cortex to the spinal cord, and their role in treatments targeting the same mechanisms.
